Self-etching adhesive is a material used in the field of dentistry, commonly used in tooth restoration and tooth bonding procedures. It is an acidic adhesive used to improve the bond between tooth tissue and restorative materials.

The main function of self-etching adhesives is to form a microscopic acidic rough layer on the tooth surface, which can form a good bond with restorative materials (such as composite resin). This rough layer increases the surface contact area between the adhesive and the restorative material, increasing the strength and durability of the bond between them.
