A Self-expanding Transcatheter Heart Valve is a type of prosthetic valve designed for transcatheter implantation that expands automatically at the target site due to its shape-memory alloy frame, typically made of nitinol. This valve does not require balloon inflation to deploy and conforms to the anatomy of the native valve, allowing for gradual, controlled expansion. It is commonly used in Transcatheter Aortic Valve Replacement (TAVR) procedures and is particularly suitable for patients with tortuous vasculature, large annulus, or high surgical risk.
