The self-floating decanter is one of the key equipment in the SBR (intermittent activated sludge process) process. It is mainly used to decant the treated supernatant from the surface during the drainage stage without stirring the sediment at the bottom of the pool, thereby ensuring the water quality of the effluent. The self-floating decanter usually consists of a decanting device, a transmission device, a skimming buoy device and a slewing bearing. Among them, the buoy adopts a floating design, so that the entire equipment can float up and down with the change of water level to maintain a stable decanting effect.

United States market for Self-floating Decanter is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Self-floating Decanter is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
