The global Self-floating Seabed Seismograph market size is predicted to grow from US$ 2370 million in 2025 to US$ 7601 million in 2032; it is expected to grow at a CAGR of 18.5% from 2026 to 2032.

A floating ocean bottom seismometer (OBS) is an instrument capable of recording minute-by-minute vibrations transmitted from the ocean floor. It can be used to record natural earthquakes and do seismic surveys of submarine structures.

The Increasing Demand For Earthquake Warning Systems Due To Rising Number Of Natural Disasters And Accidents: The unprecedented rise in average global temperature over the last few years due to increased carbon emissions is being attributed as one of the key causes behind major climatic disasters such as floods, landslides, droughts and hurricanes which are taking many lives on a daily basis. In order to avoid losses from these events occurring again in future generations, we will have to invest heavily in developing new technologies like earthquake warning systems that can detect impending earthquakes before they occur so that people are warned well ahead of time.
