The self-lubricating market is driven by the self-lubricating property present in the material. Constant lubrication and maintenance of the bearing that supports hundreds of rollers throughout the dryers can cause a burden on machines or vehicles. External oil or grease application is inhibited in the self-lubricating material which can burn off due to the high temperature of the operating system. Self-lubricating materials are free from suspended grease or oil. And this application fuels the market of self-lubricating materials. The driving property of self-lubricating material is high performance and reduces the friction of coefficient, and possesses high compressive strength and chemical resistance. And can be employed in water-bearing and high load application.
