The global Self-retaining Electric Ball Valve market size is predicted to grow from US$ 710 million in 2025 to US$ 879 million in 2031; it is expected to grow at a CAGR of 3.6% from 2025 to 2031.

The self-holding electric ball valve is a special valve device. The self-holding electric ball valve is mainly composed of two parts: the valve body and the drive mechanism. The valve body is the outer shell of the ball valve, and a channel is designed inside for fluid flow. The drive mechanism is responsible for receiving the control signal and driving the ball valve core to rotate. After receiving the open (close) valve signal, the drive mechanism of the self-holding electric ball valve is energized and drives the ball valve core to rotate. Every time the valve core rotates 90°, the function of the valve will switch once. When the valve core is in place, the internal power of the drive mechanism will be automatically cut off, and the valve position mechanical indicator will point to the corresponding valve position, and the valve position switch will also output a passive valve position signal.

United States market for Self-retaining Electric Ball Valve is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
