In a Semi-Automatic Industrial Steam Dryer, the drying process is mostly automated, with predefined drying cycles and controls for temperature, time, and drying levels. However, the steam feature requires manual intervention. To utilize the steam function, the user will add water to a designated reservoir or water inlet in the dryer. Once the steam feature is activated, the water is heated, producing steam that is released into the drying drum during specific steam cycles or through a dedicated steam refresh cycle. The steam helps to relax the fibers of the clothes, allowing for easier removal of wrinkles and refreshing the garments. It also aids in reducing static cling and eliminating odors, resulting in clothes that look and smell fresh. While the drying process is automated, the user will need to manually activate the steam feature and refill the water reservoir when required. The steam feature can be particularly beneficial for items that are difficult to iron or fabrics prone to wrinkling.
