The global Semi-automatic Probe Station market size is predicted to grow from US\$ 228 million in 2025 to US\$ 291 million in 2031; it is expected to grow at a CAGR of 4.1% from 2025 to 2031.

The semiconductor probe station is a well-established tool for testing circuits and devices on silicon wafers, dies, and open microchips.

The semi-automatic probe station is an instrument used for testing and researching microelectronic devices, finding significant demand and wide-ranging applications in the market. As microelectronic technology continues to advance, chip sizes are diminishing, making the characterization of electronic devices increasingly crucial. The semi-automatic probe station enables researchers to place samples under test, such as integrated circuit chips, onto its platform, and then employ tiny probes to measure electrical performance and signal transmission characteristics. Compared to fully automated probe testing systems, semi-automatic probe stations are more cost-effective and suitable for medium to small-scale research laboratories or businesses. However, with the progression of automation technology, the use of fully automated systems is on the rise in certain large-scale production environments. Consequently, while the semi-automatic probe station market remains stable, it might face competition from fully automated systems in the future.
