The semi-automatic X-ray inspection machine is a device that uses the principle of X-ray transmission to take real-time photo inspections of the internal structure of the object being tested. It is widely used in battery, SMT, LED, electronic product processing, casting processing and other industries, and is mainly used for practical analysis of internal defects in products. This device allows users to easily obtain high-quality, high-magnification, high-resolution images. During operation, some steps of the semi-automatic X-ray inspection machine require manual operation, such as using an automatic loader to place a series of sample racks into the machine. Other steps such as part loading and identification, program selection, data collection, analysis and reporting are fully automated. This semi-automated process helps ensure reproducible and operator-independent results.
