Semi-insulating silicon carbide single crystal substrate is a silicon carbide material with high purity and high resistivity. It can be used to make high-frequency and high-power microwave radio frequency devices, such as gallium nitride (GaN) heterojunction fields. effect transistor (HEMT). The preparation of semi-insulating silicon carbide single crystal substrates is difficult. It requires growing silicon carbide ingots through physical vapor transport (PVT) in a full vacuum environment, and then processing them into substrate wafers through cutting, grinding, polishing and other processes. The advantage of the semi-insulating silicon carbide single crystal substrate is that it can effectively reduce the parasitic capacitance and inductance of microwave devices, improve the frequency response and output power of the device, and also improve the thermal stability and reliability of the device. Semi-insulating silicon carbide single crystal substrate has wide application prospects in radio detection, communications, radar, aerospace and other fields.

The global Semi-Insulating Silicon Carbide Single Crystal Substrate market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
