This impeller of semi-open vortex pump has a back shroud with vanes open to the incoming liquid. It permits solids to pump out easily, but it will wear as solids contact the vanes. With wear, the impeller clearances increase and slipping and recirculation occur, reducing the efficiency. It clogs less than an enclosed impeller, but can still get wrapped up at times. Luckily, it is easier to unclog than an enclosed impeller with its open-face design. Semi-open vortex pumps can achieve higher and longer lasting efficiency through adjustable impeller openings-also under wear conditions.
