Chemical-mechanical polishing retainer rings are used to polish wafer meant for the semiconductor industry. A process for planarization of wafers is nowadays an integral part in every semiconductor production facility. This step is done before patterning the wafer to provide a flat surface for exposing different mask images on. Pressure is applied to the wafer cover usually with a slurry which will polish the wafer as well so called retaining rings are used to keep the wafer in position during the polishing process.

The global Semiconductor Chemical Mechanical Polishing Retaining Rings market size is projected to grow from US\$ 99.4 million in 2023 to US\$ 152.7 million in 2030; it is expected to grow at a CAGR of 6.3% from 2024 to 2030.
