Semiconductor Chiller is mainly used to precisely control the temperature of the reaction chamber in the semiconductor manufacturing process. It is a self-balancing circulation device mainly composed of a heat exchanger, a circulation pump, a compressor and a control system. It belongs to the temperature control equipment in the production process. Semiconductor special temperature control equipment uses the heat exchange principle of refrigeration cycle and process cooling water to control the temperature, flow and pressure of the circulating fluid used in semiconductor process equipment with high precision to achieve the temperature control requirements of semiconductor process. It is an integrated circuit manufacturing Indispensable key equipment in the process. According to the requirements of different processes, the circulating liquid at a given temperature is controlled to flow through the electrodes or the walls in the reaction chamber of the semiconductor process equipment, and heat is brought into the semiconductor-specific temperature control equipment, which transfers the heat to the refrigeration through the heat exchanger. refrigerant, and then release the heat to the process cooling water through the refrigerant, so as to realize the temperature control of the process.

The global Semiconductor Chiller market size is projected to grow from US\$ 670 million in 2024 to US\$ 984 million in 2030; it is expected to grow at a CAGR of 6.6% from 2024 to 2030.
