The global Semiconductor Copper Wire Bonding Equipment market size is predicted to grow from US$ 493 million in 2025 to US$ 791 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

Wire bonding is a technique that connects tiny electrodes on a chip to external circuits. The function is to connect the chip electrodes with the DBC board using metal wires, forming an internal electrical connection within the module. In IGBT modules, the quality of wire bonding directly affects the electrical performance and reliability of the module. When wire bonding, it is required that the wire diameter of the bonding wire is appropriate and the length is equal; The bonding points are firmly connected, evenly distributed, and meet the flow requirements. In the field of semiconductor packaging, metal leads are the bridge connecting chips and external circuits, directly affecting the performance of chips. Therefore, the quality of wire bonding is crucial. The material, diameter, bonding pressure, bonding time, and bonding temperature of the metal wire can all affect the bonding quality. For example, if the diameter of the metal wire is too large, it will increase parasitic inductance and affect the high-frequency performance of the module; However, a diameter that is too small can lead to insufficient bonding strength and reduce the reliability of the module. Therefore, optimizing these process parameters is the key to improving the quality of wire bonding. At present, the commonly used bonding wires for IGBT include aluminum wire, copper wire, aluminum clad copper wire, etc.Copper wire bonding equipment mainly connects copper wires (or other metal wires) to the electrode pads of semiconductor chips or the I/O leads of electronic packaging shells through heating, pressure, and ultrasound. Copper wire bonding equipment is a key device used to achieve copper wire bonding processes, and has a wide range of applications in microelectronics packaging, semiconductor manufacturing, and other fields.With the continuous development of semiconductor

At the same time, intelligence and networking will also become important trends in device development. Through the integration of sensors, IoT technology, and big data analysis, remote monitoring, fault warning, and intelligent maintenance of devices can be achieved.
