The global Semiconductor Encapsulants & Underfills market size is predicted to grow from US\$ 3826 million in 2025 to US\$ 6569 million in 2032; it is expected to grow at a CAGR of 8.2% from 2026 to 2032.

Encapsulants are materials used to encase or encapsulate semiconductor chips or dies within a protective housing or package. They are typically applied in liquid form and then cured to form a solid, protective layer around the semiconductor device. Underfills are materials applied beneath semiconductor chips or dies after they have been attached to a substrate, such as a printed circuit board (PCB) or a lead frame. Underfills are typically dispensed in liquid form and then flowed beneath the chip, filling the gap between the chip and the substrate. After dispensing, the underfill material is cured to form a solid, mechanically stable bond between the chip and the substrate.

The Semiconductor Encapsulants & Underfills market has been experiencing high growth driven by several factors:

Increased Demand for Electronic Devices: The proliferation of electronic devices across various industries such as consumer electronics, automotive, healthcare, and telecommunications has led to a surge in demand for semiconductor encapsulants and underfills. These materials are essential for protecting delicate semiconductor components from environmental factors, mechanical stress, and moisture.

Advancements in Semiconductor Packaging Technologies: The semiconductor industry is constantly evolving, with manufacturers striving to develop smaller, faster, and more efficient devices. This trend has spurred the adoption of advanced packaging technologies such as flip-chip packaging and system-in-package (SiP), driving the

demand for encapsulants and underfills.

Rising Complexity of Semiconductor Designs: As semiconductor designs become more complex, the need for robust encapsulation and underfill materials increases. These materials help enhance the reliability and durability of semiconductor devices, especially in applications subjected to harsh operating conditions or extreme temperatures.

Growing Focus on Miniaturization and Integration: There is a growing emphasis on miniaturization and integration in the semiconductor industry to meet the demands for smaller and more powerful electronic products. Encapsulants and underfills play a crucial role in enabling the miniaturization of semiconductor packages while ensuring high performance and reliability.
