The semiconductor metal curing ovens is a type of curing equipment used in the manufacturing process of semiconductor devices. It is mainly used to solidify metal wires or metallized layers so that they are firmly bonded to the semiconductor substrate and form a reliable conductive connection. The working principle of this curing oven is to use high temperature to heat the metallization layer or metal wire to form a strong connection on the semiconductor substrate, thereby realizing the connection and function of the circuit. Usually, semiconductor metal curing furnaces use electric heating or infrared heating technology to control the heating temperature and time to ensure the curing quality and stability of the metallized layer or metal wire.
