A Semiconductor Mold Cleaning Sheet is a specialized functional material designed to remove residues from mold cavities during the semiconductor encapsulation process. Typically composed of high-grade synthetic rubber or resin bases infused with specific cleaning agents, the sheet is placed into the transfer molding machine. Under high temperature and pressure, the cleaning compound melts and flows to fill every intricate detail of the mold, effectively lifting epoxy molding compound (EMC) residues, wax buildup, and other contaminants through physical adhesion and chemical dissolution. This in-line cleaning method extends mold lifespan and enhances packaging yields without the need for manual scrubbing or mold disassembly.

In 2025, global Semiconductor Mold Cleaning Sheet production reached approximately 15 million units
