Semiconductor plasma cleaning machine is a new high-tech technology, using plasma to achieve the effect that conventional cleaning methods can not achieve. Plasma is a state of matter, also known as the fourth state of matter, which does not belong to the common three states of solid, liquid and gas. When enough energy is applied to the gas to ionize it, it becomes a plasma state. The 'active' components of plasma include ions, electrons, atoms, active groups, excited Nuclides (metastable state), photons, etc. Plasma cleaning machine is to use the properties of these active components to treat the sample surface, so as to achieve the purpose of cleaning and coating.
