The global Semiconductor Silicon Parts market size is predicted to grow from US$ 1756 million in 2025 to US$ 2773 million in 2031; it is expected to grow at a CAGR of 7.9% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

This report studies the semiconductor silicon parts, including silicon electrodes and silicon rings, used for plasma etching machine.

Silicon rings for etching are mainly used on 8-12 inches (i.e., 200mm-300mm) plasma etcher. In the manufacturing process of integrated circuits, high-purity silicon components and wafers are made of silicon, which makes the electrical properties of etching more uniform, so silicon rings are widely used in semiconductor etchers. The periodic consumption of silicon ring products has become an important consumable component in the wafer processing process, which directly affects the electrical properties of the wafer. For example, a silicon ring needs to be replaced after processing about 200 wafers. The market demand for silicon rings is mainly driven by the wafer processing capacity of chip factories. According to the current global wafer production situation, the global annual demand for 8-inch silicon rings is about 300,000 pieces, and the number of 12-inch silicon rings is about 500,000 pieces. The total market size is about 3.3 One hundred million U.S. dollars. The main technical requirements of the silicon ring include electrical parameters (i.e., conductivity type, resistivity, and radial resistivity change), geometric size, crystallographic orientation, and degree of deviation from crystallographic orientation, oxygen content, carbon
