## Abstracts

The global Semiconductor Ultrapure Water System market size is predicted to grow from US$ 1939 million in 2025 to US$ 3244 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

Ultrapure water is water that has undergone a series of physical and chemical treatments to reduce impurities such as ions, organic matter, particles, microorganisms, and dissolved gases in the water to extremely low levels. Its purity is close to theoretical H2O, and its resistivity usually reaches 18.2 M??cm (25?C), which meets the strict requirements of the semiconductor industry. The ultrapure water preparation technologies widely used in the semiconductor industry mainly include ion exchange and electrodeionization (EDI). The ion exchange method mainly uses ion exchange resins to adsorb anions and cations in water to increase resistivity, and at the same time configures devices to remove DO and degrade TOC. This process has the advantages of large water preparation volume, stable effluent water quality, mature technology, stable operation, low operating difficulty, and low operating cost.

United States market for Semiconductor Ultrapure Water System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Semiconductor Ultrapure Water System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
