Wafer carrier mainly play the role of placing and transporting wafers in semiconductor production. In order to simplify transportation and minimize the risk of contamination, chip manufacturers use wafer cassettes to transport and store wafers. There are symmetrical grooves inside the wafer box, and the size is strictly uniform to support the two sides of the wafer. Usually, a wafer box contains 25 wafers. Wafer boxes are generally made of temperature-resistant, wear-resistant, and anti-static translucent plastic materials, and additives of different colors are used to distinguish metal process sections in semiconductor production. Due to the small critical size of semiconductors, dense patterns, and very strict granularity requirements in production, the wafer cassette must ensure a clean environment to connect to the microenvironmental box reaction chambers of different production machines
