The global Semiconductor Wet Cleaning Fluorinated Liquid market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Fluorinated liquid is usually a colorless, transparent, low-viscosity, non-flammable liquid with high safety and low surface tension. These characteristics enable fluorinated liquid to penetrate into the tiny gaps of precision electronic instruments and provide a comprehensive and thorough cleaning effect.

Fluorinated liquid is used as a cleaning agent to remove impurities and residues on the surface of wafers during the semiconductor manufacturing process. Its low surface tension and excellent solubility make the cleaning effect more thorough, which helps to improve the performance and yield of semiconductor devices. After the wet cleaning step, fluorinated liquid can be used for dehydration and drying of wafers. By taking advantage of its low surface tension characteristics, the moisture on the wafer surface is removed through the Marangoni effect, avoiding the problems that may be caused by using traditional IPA (isopropyl alcohol) as a desiccant, such as residue and flash point risks.

As devices become smaller and more complex, there's a growing need for advanced cleaning solutions that can effectively remove contaminants from intricate chip designs.

Environmental regulations are prompting manufacturers to seek eco-friendly alternatives to traditional fluorinated chemicals, driving research into less harmful cleaning agents.

Companies are investing heavily in research and development to innovate cleaning chemicals that meet the stringent cleanliness requirements of advanced semiconductor devices.
