The global Sensor-Based Ore Sorting Machines market size is predicted to grow from US\$ 462 million in 2025 to US\$ 820 million in 2032; it is expected to grow at a CAGR of 8.7% from 2026 to 2032.

Sensor-based ore sorting is a non-disruptive technology in mining that responds to mega-trends such as the reduction in ore grades and increasing effort to reduce the specific resource input per tonne of product produced. It is a generic term for all physical separation processes in which material properties are detected by a sensor system and subsequently rejected through an amplified mechanical, hydraulic or pneumatic process.

Different sensors at various relevant positions in the process flow allow wide application in all segments of mineral production for a variety of mineral commodities, e.g. ferrous metals, non-ferrous metals, industrial minerals, coal and diamonds.

The use of sensor technology for sorting enables separation according to completely new criteria and opens up new possibilities for the mining industry. Sensor-based sorting processes are separation processes that do not require process chemicals or water and have significant energy-saving potential when used to separate barren by-products before energy- and water-intensive beneficiation processes.

United States market for Sensor-Based Ore Sorting Machines is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
