Sequential shift paddles are devices installed behind the steering wheel or on the steering column of a car to manually control the vehicle's transmission shifting operation. Sequential shift paddles are connected to the vehicle's transmission control system through electronic signals. When the driver operates the paddles, the paddles send corresponding signals to the transmission control unit, and the control unit performs the shifting operation according to the signal instructions. Compared with traditional manual shift levers, sequential shift paddles can achieve faster shifting operations. The driver does not need to remove his hands from the steering wheel, but only needs to gently flick the paddles to complete the shifting, which greatly shortens the shifting time and improves the responsiveness and controllability of driving. The operation of sequential shift paddles is very simple and convenient, and the driver can perform the shifting operation without distracting his attention. This is very helpful for driving scenarios that require frequent shifting, such as mountain roads and curved roads.
