The global Serf Atomic Magnetometer market size is predicted to grow from US\$ 156 million in 2025 to US\$ 283 million in 2032; it is expected to grow at a CAGR of 9.1% from 2026 to 2032.

SERF atomic magnetometer is a highly sensitive magnetic field measurement device based on the principle of spin exchange relaxation suppression of alkali metal atoms. It can achieve magnetic field detection at the femtotesla (fT) level in extremely weak magnetic field environments. Its core feature is that through high-temperature heating and optical pumping technology, atomic spin exchange collisions do not cause relaxation, thereby greatly extending the atomic spin coherence time and improving the sensitivity of magnetic field measurement.

SERF (Spin-Exchange Relaxation-Free) atomic magnetometer technology has achieved femtotesla (fT) level sensitivity in laboratory environments and has become a core tool in the field of biomagnetic field measurement. At present, North America and Europe dominate (accounting for more than 70%), mainly benefiting from scientific research investment and medical needs; the Asia-Pacific region is growing rapidly, and China, Japan and other countries have increased their research and development efforts in the biomedical field.
