## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The serum sodium electrode is an electrochemical sensor used to measure sodium ion concentration in serum. The sodium ion concentration in serum is crucial for maintaining the body's water and electrolyte balance, nerve conduction, muscle contraction and other physiological functions. Therefore, in clinical medicine, measuring serum sodium concentration is one of the routine biochemical tests. Serum sodium electrodes are usually made of specific electrode materials, and their surfaces are covered with a sodium-selective membrane or membrane combination. These selective membranes react specifically with sodium ions, causing a change in electrical potential on the electrode surface. By measuring this potential change, the concentration of sodium ions in the serum can be determined indirectly. Serum sodium electrodes are usually used in conjunction with electrochemical measuring instruments or biochemical analysis instruments to quickly and accurately measure the concentration of sodium in serum. These electrodes are widely used in clinical medicine in the diagnosis, treatment and monitoring of various diseases, such as water and electrolyte disorders, renal function abnormalities, cardiovascular diseases, etc.

The global Serum Sodium Electrode market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
