The servo driver is a device that realizes high-precision transmission system positioning by controlling the servo motor. It is the center of signal conversion and signal amplification in the servo drive and control system. By synthesizing and amplifying the input signal and feedback signal, according to the comprehensive signal The corresponding signal is output to control the forward or reverse rotation of the servo motor; when the input signal is balanced with the feedback signal, the servo motor stops rotating, and its end actuator is stabilized at a specific position.

The servo drive has the characteristics of low vibration, fast response and high-precision operation. It can be used in the manufacturing of industrial automation equipment such as industrial robots and CNC machine tools. The downstream application market involves electronics, home appliances, automobiles, medical equipment, logistics, chemicals, textiles, printing, Electric power, metallurgy, petroleum, mining, aerospace and many other industries. With the transformation and upgrading of the manufacturing industry, the market's performance requirements for production equipment continue to increase, the proportion of demand for high-end industrial automation equipment continues to increase, the market space for servo drives continues to increase, and the technical content is also constantly improving.
