Service orchestration is the arrangement and coordination of multiple interoperable services exposed as a single cumulative service. It is used for the upkeep of automation of business processes by different services across different applications and enterprises in order to create composite applications. It is the amalgamation of different service interactions to create higher-level business services. Service orchestration is a crucial part of service oriented architecture (SOA). SOA is a method of developing enterprise systems by small units of software that perform discrete/independent tasks when called upon. This interoperable software runs from separate systems across different business domains. It offers IT departments a way of reusing components from existing programs within the enterprise rather than writing redundant code from scratch.
