Sewer grease interceptor is a special device installed in the drainage system of catering kitchens. It is used to intercept animal and plant oils, food residues and solid particles in wastewater to prevent them from entering urban sewers and causing blockage and pollution. Its working principle is based on the difference in density between oil and water. It uses the internal slow-flow structure to make grease gather on the water surface, impurities settle to the bottom, and the purified water is discharged through the outlet. This equipment is widely used in restaurants, canteens, hotels, food processing plants and other places with high oil pollution discharge. Modern grease interceptors are mostly made of stainless steel or polymer corrosion-resistant materials, with automatic oil drainage, sewage monitoring and odor sealing functions. Some models also integrate intelligent sensing and remote alarm systems. They are key facilities in the pretreatment of catering wastewater and environmental compliance management.

United States market for Sewer Grease Interceptor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Sewer Grease Interceptor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
