The global Shark Chondroitin Sulfate market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Shark Chondroitin sulfate (CS) is a class of glycosaminoglycans that covalently bind to proteins to form proteoglycans. Chondroitin sulfate is widely distributed in the extracellular matrix and cell surface of animal tissues, and the sugar chain is composed of alternating glucuronic acid and n-acetylgalactosamine (also known as n-acetylgalactosamine) disaccharide units, which are connected to the serine residue of the core protein by a sugar-like link region. Chondroitin sulfate, found in everything from nematodes to humans except plants, performs many important physiological functions. Although the main chain structure of polysaccharides is not complex, it is highly heterogeneous in terms of the degree of sulfuric acid, sulfuric acid groups and the distribution of the two kinds of differences to the re-chain of isomuronic acid. The fine structure of chondroitin sulfate determines the specificity of function and the interaction with many protein molecules.

Chondroitin sulfate is commonly used as a dietary supplement for joint health, particularly in combination with glucosamine. Market trends may be influenced by the aging population and the increasing interest in maintaining joint health.
