Sheep/Goat Demineralized Whey Powder is a dairy ingredient produced from sheep or goat whey obtained during cheese manufacturing. The whey undergoes demineralization through membrane filtration, electrodialysis, or ion exchange to remove most mineral salts, followed by concentration and spray drying. The resulting powder retains whey proteins, lactose, and bioactive components while offering reduced ash content, neutral flavor, and high solubility. It is widely used in infant formulas, medical nutrition, functional beverages, and premium dairy formulations requiring low mineral levels and excellent nutritional balance.

In 2024, global production of sheep/goat demineralized whey powder reached 163.4 k tons, with an average selling price of US$13,586 per ton. A typical single-line production capacity is approximately 3,000-5,000 tons per year, and the industry's gross profit margin is approximately 35%–45%. Cost structure: Raw materials account for approximately 82%, manufacturing costs account for approximately 11%, and the remainder is labor costs, accounting for approximately 7%. Industry chain: Upstream is the fresh goat milk industry, and downstream includes infant formula goat milk powder, nutritional foods, supplements, baking, confectionery, and other industries.
