The global Shell Core Shooter market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A shell core shooter is a type of foundry machine used in the casting process to produce sand cores, which are essential components in creating intricate internal cavities or passages within metal castings. These cores are typically made of sand mixed with a binder material, such as resin, and are placed inside a mold cavity to form the desired internal shapes of the final metal casting.

The shell core shooter operates by injecting sand and resin mixture (known as sand slurry) into a heated core box or core mold under high pressure. This process results in the formation of a sand core with a thin shell on the surface, hence the name 'shell core.' The shell core shooter typically uses hot curing methods, such as gas curing or microwave curing, to rapidly harden the resin binder and solidify the sand core.

United States market for Shell Core Shooter is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
