A shielded proximity sensor is a sensor used to detect an object approaching or moving away. It works using the principle of electromagnetism and detects the presence or absence of an object based on the distance between the object and the sensor. How it works: Shielded proximity sensors emit electromagnetic signals, and when a target object approaches the sensor, it interferes with the electromagnetic field emitted by the sensor. The material and distance of the target object will change the characteristics of

the reflected signal received by the sensor. The sensor determines the presence or absence of a target object by analyzing the signals it receives. Shielded proximity sensors are commonly used in industrial automation and mechanical equipment for applications such as detecting the position of objects, counting, and safety control. They can detect metallic and non-metallic objects and also provide high detection accuracy for smaller target objects.
