Shingled modules are based on the number of main grids, cut the conventional cells into 5 or 6 pieces, arrange each of them in superposition, connect the small cells into strings with conductive glue, and then laminate them into modules after series-parallel layout. The increase in power of shingled modules mainly comes from the increase in the number of batteries with reduced packaging and blanks, and secondly from the reduction in current consumption caused by the elimination of solder ribbons and the reduction of battery slices. At present, there are 2 basic versions of conventional components on the market, type 60 and type 72. The shingled component has broken through the original layout design. In addition to the 60 and 72 extended types, a quasi-78 type has appeared.
