The global Ship Autonomous Navigation Technology market size is predicted to grow from US\$ 312 million in 2025 to US\$ 570 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

Ship Autonomous Navigation Technology refers to an integrated technological system that enables vessels to perceive their environment, plan routes, make collision-avoidance decisions, and control navigation autonomously or semi-autonomously by leveraging artificial intelligence, machine learning, multi-sensor fusion (such as radar, AIS, cameras, and GPS), decision-making algorithms, and ship-to-shore communication systems. It supports different levels of autonomy, from assisted navigation to fully autonomous operation, improving safety and operational efficiency while reducing human intervention.

Ship autonomous navigation technology is driving the global maritime industry toward intelligent and unmanned operations. Its core value lies in significantly improving navigation safety and operational efficiency through AI-based decision-making and multi-source data fusion, while optimizing routing and fuel consumption. However, the technology is still in an early commercialization stage, constrained by system reliability challenges in complex maritime environments, lack of unified international regulations and liability frameworks, and underdeveloped ship-to-shore communication infrastructure. As a result, applications are currently dominated by assisted and semi-autonomous navigation, while full-scale autonomous deployment will require further technological and regulatory maturation.
