Shipboard Magnetometer is an instrument used to measure the strength and direction of the Earth's magnetic field on board a ship. This information is important for navigation, as the magnetic field can affect compass readings and the accuracy of course plotting. The magnetometer works by detecting the small variations in the Earth's magnetic field caused by the presence of magnetic minerals in the ocean floor or the presence of underwater structures. This data is often used by geologists and

oceanographers to study the ocean floor and its geological history.
