The shipborne optoelectronic system is a system installed on vessels that comprehensively utilizes optics and electronic technology for target detection, tracking, identification, and imaging. It typically consists of a biaxial gimbal and various types of lenses. This system integrates multiple optoelectronic sensors, such as visible light cameras, infrared thermal imagers, laser rangefinders/illuminators, to provide target information for vessels in complex marine environments. Its working principle involves using optoelectronic sensors to receive optical signals reflected by targets or emitted by them, converting these signals into electrical signals for processing, thereby enabling target monitoring and analysis.
