The global Ships Low-flashpoint Fuel Supply System market size is predicted to grow from US\$ 1791 million in 2025 to US\$ 25654 million in 2032; it is expected to grow at a CAGR of 47.2% from 2026 to 2032.

A Ships low-flashpoint fuel supply system is a marine fuel delivery unit designed for fuels with a flash point below 60°C, such as methanol, ethanol, LPG, DME, or ammonia. The system integrates sealed pipelines, explosion-proof valves, gas detection, and automated control technologies to ensure the safe storage, transfer, pressure regulation, heating, and supply of the fuel. It enables stable combustion of low-flashpoint fuels in main engines, auxiliary engines, or boilers while complying with the IMO's International Code of Safety for Ships Using Gases or Other Low-Flashpoint Fuels (IGF Code). Low-flashpoint fuel supply systems are usually customized according to the size and type of the ship, and their prices fluctuate greatly.

The market for shipboard low-flashpoint fuel supply systems is currently transitioning from a phase dominated solely by LNG to a multi-fuel era featuring the parallel development of LNG, methanol, hydrogen, ammonia, and other alternatives. Fundamentally, these systems provide vessels utilizing low-flashpoint or gaseous/liquid alternative fuels with a complete fuel handling chain spanning everything from storage tanks, pumps, vaporization/pressurization units, filtration, heat exchange, and valve blocks to double-walled piping, safety monitoring, and final delivery to the engine. Currently, the most mature technology is the LNG Fuel Gas Supply System (FGSS), which has already seen large-scale application across major container ships, oil tankers, bulk carriers, Pure Car and Truck Carriers (PCTCs), and gas carriers. The fastest-growing segment is the methanol Low-Flashpoint Fuel Supply System (LFSS); this growth is driven by methanol's liquid state at ambient temperatures, which simplifies

storage, transport, and vessel retrofitting compared to LNG, hydrogen, or ammonia. MAN Energy Solutions, for instance, defines the methanol LFSS as a dedicated system designed to deliver fuel to the engine while meeting specific requirements regarding temperature, flow rate, and pressure. Ammonia and hydrogen fuel supply systems remain in the demonstration and early commercialization stages, constrained primarily by safety regulations, fuel availability, the complexities of handling toxicity, cryogenic temperatures, and high-pressure storage, as well as the requirements for classification society approvals. According to IMO data, LNG has already been fully incorporated into the *IGF Code* (International Code of Safety for Ships using Gases or other Low-flashpoint Fuels), whereas fuels such as ammonia still rely largely on interim safety guidelines. From the demand perspective, the market is primarily driven by IMO emission reduction targets, the EU's *FuelEU Maritime* initiative, ESG pressures on shipowners, a rising volume of orders for alternative-fuel vessels, and the multi-fuel diversification strategies of engine manufacturers. Key market participants include Wärtsilä, Everlence, Alfa Laval, HD Hyundai Heavy Industries, CSSC, TGE Marine, LGM Engineering, Kongsberg, Mitsubishi Shipbuilding, Auramarine, and Högglund; these various companies specialize in distinct segments, ranging from LNG FGSS, methanol LFSS, and ammonia/hydrogen storage and supply systems to control systems and cryogenic equipment. Future market trends are expected to emphasize multi-fuel compatibility, modular skid-mounted designs, dual-fuel or retrofit-ready configurations, intelligent safety monitoring, deep integration with engine systems, and an expansion of services from new shipbuilding projects to vessel retrofits. The primary challenges facing the market include the high cost of alternative fuels, insufficient port bunkering infrastructure, uncertainties regarding future fuel pathways, long return-on-investment periods for shipowners, evolving safety regulations, and the ongoing technological competition among methanol, ammonia, hydrogen, and LNG. Overall, it is projected that over the next 5-10 years, LNG will continue to generate the largest share of recurring revenue in this market, while methanol systems will account for the most significant volume of new orders; meanwhile, ammonia and hydrogen systems are expected to see a gradual ramp-up in volume—initially within demonstration vessels, offshore vessels, ferries, harbor craft, and a select number of green shipping projects.
