The Shore B hardness tester is an instrument used to measure the hardness of materials. It uses the Shore B hardness testing method. This test method is a standard test method defined by the American Society for Testing and Materials (ASTM) and is commonly used to measure the hardness of plastics, rubber, and other non-metallic materials. The Shore B hardness test is based on the principle of spring rebound. During the test, the hardness tester applies a constant force to the surface of a material through a spring-driven probe, and then measures the height of the spring rebound to evaluate the hardness of the material. According to the height of spring rebound, the hardness value of the material can be calculated, which is usually related to the elastic modulus of the material.

The global Shore B Hardness Tester market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
