The Shore C hardness tester is an instrument used to measure the hardness of materials. It uses the Shore C hardness testing method, which is a dynamic hardness testing method. In this test method, a rigid tapered needle (often called a Shore needle) is pressed into the surface of the material at a certain speed and the resistance of the needle at a certain depth is measured. Shore C hardness tester can be used to test the hardness of various materials, including rubber, plastics, soft metals, brittle materials, etc. The working principle of the Shore C hardness tester is to evaluate the hardness of a material by measuring the resistance of a Shore needle when it is pressed into a certain depth under the surface of the material. Hardness values are usually expressed as force per unit area, such as kilograms of force per square millimeter (kgf/mm<sup>2</sup>) or Newtons per square meter (N/mm<sup>2</sup>) in the SI system of units. The results of the Shore C hardness tester are usually expressed in terms of the Shore C hardness value (Shore C), which is a logarithmic value with a hardness value of 100 on the base surface.

The global Shore C Hardness Tester market size is projected to grow from US\$ 14.3 million in 2024 to US\$ 19.4 million in 2030; it is expected to grow at a CAGR of 5.2% from 2024 to 2030.
