The global Short Carbon Fiber market size is predicted to grow from US\$ 453 million in 2025 to US\$ 819 million in 2031; it is expected to grow at a CAGR of 10.4% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Short Carbon Fiber refers broadly to carbon fibers with relatively short lengths (typically less than 50mm), including both virgin chopped fibers and fibers generated from processing, trimming, or recycling operations.

In recent years, the short carbon fiber market has shown the following trends:

The market scale continues to expand: Driven by the growth of demand in downstream industries, the scale of the short carbon fiber industry will maintain a rapid growth state.

Technological progress: Technological evolution is mainly focused on fiber surface active treatment technology, size distribution control and other directions to improve the interface bonding and mechanical properties of composite materials.

Thermoplasticization trend is significant: Thermoplastic matrix with short carbon fiber has become a key growth point, suitable for rapid injection molding and large-scale application scenarios, and is the technical focus of future product competition.

The vertical integration of the industrial chain is accelerating: Head companies are deploying upstream raw fiber supply, while extending downstream to composite material parts, gradually building an integrated industrial chain of 'raw fiber-short chopped-

composite-terminal application' to increase product added value.
