The global Short Dental Implants market size is predicted to grow from US\$ 4971 million in 2025 to US\$ 7527 million in 2031; it is expected to grow at a CAGR of 7.2% from 2025 to 2031.

Dental implants are medical devices surgically implanted into the jaw to restore a person's ability to chew or their appearance. Dental implants with intra-bony lengths of less than 10, 8 or 7 mm are defined as short implants in different studies. In this report, implants with lengths of 10 mm or less are considered short. The vast majority of dental implants used worldwide are made of Titanium. Titanium is used in dental implants because it is light, strong, biocompatible (the body doesn't react to it), and most importantly it bonds to the bone. It has been used for over 50 years and has been well studied and observed over that time. Dental implants are usually made of an alloy containing 90% Titanium. The remainder comprises of other metals to give the implant additional strength such as aluminium and vanadium.

According to our research, the global market for medical devices is estimated at US\$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing

awareness about early disease diagnosis and treatment.
