## Abstracts

The global Short-fiber Nonwoven Geotextile market size is predicted to grow from US\$ 2761 million in 2025 to US\$ 4502 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

A short-fiber nonwoven geotextile is a permeable geosynthetic material manufactured from synthetic staple fibers (primarily polyester PET or polypropylene PP). The production process involves fiber opening, carding, web formation, and subsequent reinforcement through mechanical needling, thermal bonding, or chemical bonding. Resembling felt in appearance, it features a stable three-dimensional network structure formed by the random interlocking of countless fibers. This structure provides excellent mechanical, filtration, and separation properties, enabling it to perform critical functions in geotechnical engineering such as filtration, drainage, separation, reinforcement, and protection. It is one of the most widely used geotextiles in infrastructure construction. In 2025, global Short-fiber Nonwoven Geotextile production reached approximately 1763.7 kilotons, with an average global market price of around US\$ 1.6 per kg.

The growth of the short-fiber nonwoven geotextile market is primarily driven by factors such as continued increases in infrastructure investment, rising demand from environmental protection and water conservancy projects, and accelerated urbanization. Countries worldwide are increasingly demanding separation, filtration, and reinforcement materials in projects such as highways, railways, sponge cities, landfills, and tailings ponds. Simultaneously, stricter environmental regulations are promoting leachate control and soil and water conservation projects. Furthermore, short-fiber products offer cost advantages and better mechanical stability compared to long-fiber geotextiles, leading to a continuous increase in their penetration rate in developing countries and price-sensitive projects, thus driving steady overall market expansion.
