Short-path evaporators are similar to scraped film evaporators in that the liquid film formed on the inner wall of the equipment is formed by the rotation of the rotor. The gas phase is produced by vaporization by the input of heat from the wall to the liquid film. The gas phase meets the intermediate condenser, where it cools into a 'distillate' (D). This distillation flows into the condenser pipe and leaves the evaporator from the bottom nozzle. A portion of the liquid film that reaches the bottom of the evaporator is called a 'concentrate' (C). The concentrate is collected at the bottom of the device.
