Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Short Peripheral Intravenous Catheter market.

A short peripheral intravenous catheter (PIVC) is a long, thin tube that is used to inject fluid or medication directly into a vein or to draw blood samples for testing. A needle is inserted and subsequently removed from a peripheral vein (i.e., veins found in the arms, hands, legs, or feet), leaving a small tube (the cannula) at the insertion site.

During 2017, the non-ported short PIVC segment dominated the peripheral IV catheter market and accounted for a major part of the overall market share. The key driver for the dominance of this segment is the development of non-ported peripheral venous catheter with multi-use blood control septum, which augments the efficiency of the procedure and is clinically well recognized.
