The global Shortwave Radiant Heater market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The shortwave radiant heater is a type of electric heater that emits infrared radiation in the shortwave range, typically between 1 and 2 micrometers. These heaters work by heating objects directly rather than heating the surrounding air. The heat from a shortwave radiant heater can be felt almost immediately upon turning it on, making them a popular choice for outdoor patios and commercial heating applications. They are also used in industrial settings where targeted heating of specific areas or objects is required. Shortwave radiant heaters are often more energy efficient than traditional heating methods because they do not need to heat up the entire room or space. Instead, they focus heat directly on the target area, reducing wasted energy and lowering operating costs.

The main consumer market of Shortwave Radiant Heater is North America and Europe. With the gradual recovery of the global economy after the COVID-19 pandemic and the return of major economies to normal, there will be some growth in the manufacturing sector. Under the common influence of the war between Russia and Ukraine and the energy crisis, consumers in Europe and America put forward new requirements for heating equipment. As a result, the demand for Shortwave Radiant Heater will vary within predictable times.
