The shovel tooth heat sink is a device used for heat dissipation. It adopts a series of tooth-shaped structures to increase the surface area of the heat sink and improve the heat dissipation efficiency. The working principle of the shovel tooth heat sink is to conduct heat from the device to the surface of the heat sink, and then dissipate the heat to the surrounding air through natural convection or the assistance of a fan, thereby reducing the temperature of the device.

The advantage of shovel tooth heat sinks is that they have a larger surface area and can dissipate heat more efficiently. In addition, its design structure can also increase the turbulence effect of air flow and improve the heat dissipation effect.
