The global Si-Based Micro-Display market size is predicted to grow from US\$ 64.14 million in 2025 to US\$ 573 million in 2032; it is expected to grow at a CAGR of 36.9% from 2026 to 2032.

In 2025, global Si-Based Micro-Display production reached approximately 160k units , with an average global market price of around US\$400 per unit.

A silicon-based micro-display is a miniature display device that uses a single-crystal silicon wafer as the backplane with integrated CMOS driving circuits, combined with emissive or light-modulating layers such as OLED, liquid crystal, or micro-LED. Typically ranging from a few millimeters to a few inches in size, it features ultra-high pixel density, high resolution, and low power consumption. By combining semiconductor manufacturing with display technologies, silicon-based micro-displays enable high integration and miniaturization, making them ideal for near-eye applications such as AR/VR headsets, electronic viewfinders, and head-up displays. They are broadly classified into emissive types (e.g., Micro-OLED, Micro-LED) and light-modulating types (e.g., LCoS), playing a key role in next-generation spatial computing devices.

The upstream of the silicon-based micro-display industry includes silicon wafer suppliers such as Shin-Etsu Chemical and SUMCO, OLED material providers such as Universal Display Corporation, liquid crystal materials and optical component suppliers, and semiconductor equipment companies like Applied Materials. The midstream consists of micro-display chip designers and manufacturers such as Sony, Himax Technologies, and eMagin, integrating silicon backplanes with display layers. Downstream applications include AR/VR device manufacturers such as Apple and Meta Platforms, automotive HUD suppliers, and industrial/medical display systems, forming a

full value chain from semiconductor materials to end-user devices.
