In the SiC Epitaxial CVD system, silicon source and carbon source are introduced in the form of gaseous precursors by accurately controlling the gas flow, temperature, pressure and atmospheric conditions in the reaction chamber, and allow them to melt on the pre-prepared single crystal SiC substrate. A chemical reaction occurs on the substrate, resulting in the growth of a high-quality SiC film oriented along the crystal plane of the substrate that matches the crystal lattice of the substrate. This kind of film is usually used to manufacture high-performance power semiconductor devices, such as diodes, MOSFETs, IGBTs, etc. These devices are widely used in electric vehicles, solar inverters, power conversion systems and other fields that require extremely high efficiency and reliability.

The global SiC Epitaxial CVD System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
