SiC flat membrane is made of high-purity silicon carbide powder sintered at high temperature. It is currently the best membrane material with hydrophilicity and anti-pollution ability. It has a highly negatively charged membrane surface, which can ensure excellent anti-pollution properties of the membrane surface in a wide pH range; under ideal operating conditions, when PAC is added to make the pH less than 6, the membrane surface can maintain a negative charge of -25~-30 millivolts, making it difficult for dissolved organic carbon and transparent exopolymer particles to adhere to the membrane surface; Silicon carbide flat membrane can easily wash away negatively charged substances in the water from the membrane surface, such as bacteria, algae, MLSS, transparent exopolymer particles and oil substances.

The global SiC Flat Membrane market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
